

AquaBags™

Emergency Water Distribution

Aqua Bags™ are 1.5 gallon water containers made of thick, food grade plastic. They fold flat for easy storage, yet fill to create a sturdy container suitable for transport and distribution.

AquaBags provide emergency managers, international aid organizations, disaster response professionals and military users with a cost effective tool for emergency water distribution. The bags are lightweight and require minimal storage space. The 0.20mm thickness is ideal for durability in harsh conditions, but can still be considered a disposable, recyclable resource.

AquaBags can be used to distribute purified drinking water in the aftermath of a natural disaster or water disruption. Paired with First Water purification systems, they offer the ideal distribution mechanism for clean water.

AquaBags can also be used as a part of emergency preparedness kits. Empty bags are sold or distributed to a population, giving individuals and families the ability to stockpile their own water in preparation for events like hurricanes or blizzards.
